

Protect POM-VPS

Scour prevention

Oral supplement providing high-level multi-strain probiotic bacteria to prevent diarrhoea in newborn calves.

Features	Benefits
The only licensed Probiotic	Guaranteed efficacy, safety and quality.
Unique triple-strain 10 billion probiotic bacteria per course	The high level of probiotics physically exclude harmful pathogens from attaching to the gut wall. Trials have shown an average reduction in calf scour of 83%.
Produces bacteriocins in the gut	Natural antimicrobial substance which can kill harmful bacteria in the gut.
Produces lactic acid	Lower pH inhibits pathogens and improves digestion, trials have shown a 31% increase in growth rate.
Stimulates the immune system	Treated calves taking part in the scour trials showed lower levels of pneumonia.
Faecal sampling showed a wide range of pathogens present during trials (E coli., salmonella, rotavirus, coronavirus and cryptosporidium)	This demonstrated Protect's ability to protect calves against a wide range of pathogens therefore providing broad-spectrum scour prevention.
Re-establishes probiotic bacteria in the gut after antibiotic therapy	By re-establishing probiotic bacteria after antibiotics the calf will recover quicker from a diarrhoea or pneumonia incident.

When to use: Give to new born calves at birth; bought-in calves; after digestive upset or after antibiotic therapy.

Unit Size: 100ml bottle with automatic dispenser.

Dose: Prevention; 2 x 2.5 ml at birth / when brought on farm, 1 x 2.5 ml on day 2 and 3. At times of stress; 1 x 2.5 ml per day as required.

Doses Per bottle: 10 x 10ml prevention doses or 40 x 2.5 ml individual doses.
